

Preparation Requirements for the Rough Opening Based on Drainage Options

Available Drainage Options

Option 1: Sill with internal drainage tubing—high performance against water infiltration, strongly recommended for cold climates.

Option 2: Sill with external drainage tubing—standard performance against water infiltration, suitable for southern climates only.

141, Chemin des Raymond Rivière-du-Loup (Québec) G5R 4L9, Canada 1 800 463–1367 info@lepagemillwork.com LEPAGEMILLWORK.COM

Option 3: Sill with external drainage pan—good performance against water infiltration, best suited for southern climates.

Option 4: Sill with no drainage—no protection against water infiltration.

Option 5: Recessed sill with internal drainage tubing—high performance against water infiltration, strongly recommended for cold climates.

Option 6: Recessed sill with interior drainage tubing—standard performance against water infiltration, suitable for southern climates only.

Requirements Based on Drainage Option

- **Options 1 to 3:** Standard sill with or without drainage.
 - *Important*: You must include a 19.05 mm (3/4 inch) shim in your rough opening.

• **Option 4**: Sill without drainage—for interior applications or use where no protection against water infiltration is required.

- **Options 5 to 7:** Recessed sill with drainage.
 - *Important*: You must include a 19.05 mm (3/4 inch) shim in your rough opening.

• **Option 8**: Recessed sill without drainage—for interior use or where no protection against water infiltration is required.

Sill Drainage Considerations

Proper planning is essential for any sill that requires drainage:

In **cold climates** with risks of freezing, we strongly recommend installing a **drainage system with interior tubing**. A plumbing connection must be planned to integrate the door's drainage tubes and must be approved by a certified plumber.

For **concrete installations**, recesses must be provided to accommodate the sill, drainage tubing, and plumbing connections.

For **exterior drainage systems using tubes or a pan**, the connection may be directed to a French drain or a surface runoff system.

For **non-draining sills** (e.g., interior doors, covered doors, or when the client waives the drainage warranty), only a properly recessed opening in the concrete is required. For wood structures, the recess must also be appropriate to ensure proper installation and alignment.

If you choose **fully recessed doors with raised tracks**, ensure the recess depth allows for perfect alignment between interior and exterior finishes.

In **all drainage scenarios**, a **drainage pan** must be installed beneath the sill for added protection. Acceptable materials include copper, aluminum or a liquid or bituminous membrane, ensuring compatibility with building materials and compliance with local building codes.
